Importing the Arturia Presets

The Arturia presets come as a single Analog Lab bank, **Analog Lab V_Bank_RM-Synth Sounds.labx**. It works in Analog Lab Pro, the free Analog Lab Play and the V Collection instruments, and it imports every Arturia preset in the collection in one go.

To import the bank, open **Analog Lab** (standalone or VST/AU). Click the '☰' icon at the top-left, choose Import and select the .labx file from the download. The import can take a little while. When it's finished, you'll get a "Presets Imported Successfully" message, and the presets will be in your Arturia presets library, including in the individual V Collection instruments.

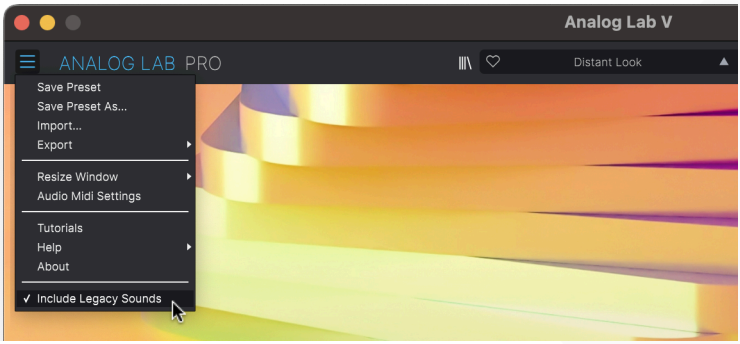

Browsing the Presets

To find the presets, open the preset browser and choose Sound Banks on the left, then select the **RM-Synth Sounds** bank. All Reverb Machine banks start with "RM-", so they're easy to find. Each preset is named after the song it comes from.

Troubleshooting

If you have any trouble importing the presets, make sure Analog Lab is updated to the latest version using the **Arturia Software Center** app. Arturia presets aren't backwards compatible, so the bank won't open in older versions such as Analog Lab 4.

If the import works but the presets don't show up in the browser, make sure '**Include Legacy Sounds**' is ticked in the Analog Lab menu.
